JUST IN TYPE'S

Befter Sans

SPECIMEN & USER'S GUIDE

A humanist sans typeface for display and short text

Paragraphs do not occur in nature. Whereas sentences are grammatical units intrinsic to the spoken language, paragraphs are a **literary convention** designed to divide masses of content into appetizing portions. Indents have been common since the XVII century. Adding space between paragraphs *(paragraph spacing)* is another standard device. On the web, a paragraph is a semantic unit *(the **<p>** tag in html)* that is typically displayed on screen with space inserted after it. A typical indent is an **em space**, or a quad, a fixed unit of space roughly the width of the letter's cap height. An em is thus proportional to the size of the type; if you change the point size or column width, the indents will remain appropriately scaled. Alternatively, you can use the *tab key* to create an indent of any depth. A designer might use this technique in order to align the indents with a vertical grid line or other page element. *Avoid indenting the very first line of a body of text*. An indent signals a break or separation; there is no need to make a break when the text has just begun. Despite the ubiquity of indents and paragraph spacing, designers have developed **numerous alternatives** that allow them to shape content in distinctive ways.
